

Placement constraints for a better QoS in clouds

Extending BtrPlace to support typing

To sum up

We define QoS as the performance, the availability, etc. provided by a cloud. Virtualization in clouds allows to

- Launch and stop services on the fly
- Replicates easily VMs running those services
- Facilitate administration

To sum up

Large firms delegates their IT infrastructure to specialized companies

- Reduction of the costs (less hardware to buy and manage, less software to write, etc.)
- Augmentation of the QoS

However, by doing so, those firms:

- Lose control over their data
- Become dependent of another company

Different types of services

To sum up

There are different kind of hypervisor,
with different features,
and different licences;

Need for a software at the Infrastructure level to place a set of
VMs on a set of nodes. Would be usefull to teach this software
about available hypervisors, their fonctionnality, etc.

BtrPlace is a flexible software that aims

- to solve the problem of distributing a set of VMs on a set of nodes
- to be efficient and moreover extensible

Constraints:

- imposed by the hardware, such as available ressources
- given by the user, following his needs (eg. replication of VMs)
- imposed by hypervisors licences

As it competitors, doesn't make the distinction between hypervisors.

however designed to be extensible \Rightarrow should be reasonably easy to augment it to support typing.

To sum up

We worked incrementally by

- 1 modeling and implementing a special case of the typing
- 2 modeling and implementing the general case
- 3 implementing some constraints associated to typing problems

To sum up

Hypothesis: we know which nodes are going to change their hypervisor, and the name of the new hypervisor.

For such a node, the following constraints must be satisfied:

$$P(c) = n \Rightarrow c^{\text{ed}} \leq D^{\text{st}}$$

$$P(d) = n \Rightarrow d^{\text{st}} \geq D^{\text{ed}}$$

Placement satisfied iff:

$$P(v) = n \Rightarrow T(n) = T(v)$$

This special case is implemented through a constraint $Platform((n_i, h_j), (n_{i+1}, h_k), \dots)$. There are two main methods in this class:

- 1 **inject**, which inject into Choco the two previous constraints
- 2 **isSatisfied**, which ensures the injected constraints are indeed satisfied in the new configuration

To sum up

BtrPlace should now deduce the new type of the nodes.

We add a vector v_i to each node. $v_i[t]$ represents the number of VMs running under the hypervisor t . The placement is satisfied iff:

$$(\exists! x \in v_i), x \neq 0$$

Currently, only the model has been defined correctly, no working code.

MinPlatform

$MinPlatform(nodes, type, n)$ ensures at least n nodes from $nodes$ runs hypervisor $type$.

Figure : $MinPlatform((N1, N2, N3), "ESX", 2)$

MaxVM

MaxVM(nodes, type, n) ensures at most n nodes runs hypervisor *type*.

Other PFE project proposed by Fabien in response to licence limitations (VMWare notably) is easily implemented because typing is done with integer.

$\text{MaxVM}((N1), \text{"VMWare"}, 4)$

Modelisation in BtrPlace
Special case
General case
Additional constraints

Management
Problems encountered
Incomplete work

To sum up

Problem:

- not enough time spent on timing the work;
- incoherence in the DOW observed too late,

Possible Solution:

- spend more time on timing and structuring the work
- try to evaluate better exogenous elements (mainly other scholar works).

Complexity of BtrPlace

BtrPlace, a placement manager

Adding typing in BtrPlace

Modelisation in BtrPlace
Special case
General case
Additional constraints

Management

Problems encountered
Incomplete work

To sum up

Problem : only documentation available : API Java.
Inadequate and insufficient to understand fully BtrPlace.

Possible solution : add two layers of documentation.

- 1 one describing the general structure of the software, with some example
- 2 and an other describing model generation and how to write simple constraints

What's done and what's missing?

Management
Problems
encountered
Incomplete
work

To sum up

- add more test for the special case (2 or 3 hours)
- implement general case at the right place, not as a user constraint, and test it (difficult to estimate)
- describe underlying models for constraints *MinPlatform* and *MaxVM*; complete and revised the implementation following the new models (1 or 2 hours)

Possible evolutions thanks to typing

Incomplete
work

To sum up

Hypervisors licences and features can be pretty different:

- some allows migrating VMs, some don't
- some put restrictions on usable hardware (number of NIC, RAM, CPU usable by the hypervisor)
- etc.

Typing could help modelize those limitations.
